Week 2: I created a blob that portrays the emotion “excitement” using p5.js

The primary choice I made was to increase the rate of wobbling, speed, and motion to transform the calm blob into a very excited and energetic one.

I used a very little amount of ai to explain certain lines of code so I could remember how they affect the blob.

ChatGPT Transcript:

- The `noise()` line gives smooth randomness so the blob’s edge moves in and out organically.
- The `r = blob.r + map(...)` line converts that noise into how far each point pushes outward.
- The `vertex(centerX + cos(a) * r, centerY + sin(a) * r)` line turns angle + radius into actual x/y positions on screen.
